

Online Survey & Feedback System – Modular Breakdown

This report divides the **Online Survey & Feedback System** project into **5 detailed modules**. Each module has been explained with responsibilities, components, and graphical representation where applicable. The aim is to create a structured roadmap for implementation and evaluation.

Module 1: Survey Builder (Admin Panel)

The Survey Builder serves as the central management tool for administrators. It allows creation, customization, and control of surveys.

- **Survey Management:** Create, edit, and delete surveys.
- **Dynamic Form Builder:** Support for MCQs, text, ratings, and dropdowns.
- **Publishing Controls:** Publish/unpublish surveys.
- **Access Rights:** Set survey availability and participant permissions.

Module 2: Participant Portal

The Participant Portal enables easy access to surveys and secure submission of feedback.

- **Survey Access:** Join surveys through unique links or login.
- **Response Submission:** Submit answers securely.
- **Anonymous Feedback:** Option to submit without identity.
- **Acknowledgment:** Confirmation after successful submission.

Module 3: Result Dashboard

The Result Dashboard provides administrators with tools to analyze responses and extract insights.

- **Response Aggregation:** Collect and process participant inputs in real time.
- **Visual Statistics:** Generate charts, graphs, and trends.
- **Filtering Options:** Filter data by date, demographics, or question type.
- **Report Export:** Download analytics in CSV/PDF formats.

Module 4: Security & Performance

This module ensures secure access and optimized performance of the system.

- **Role-Based Access:** Admin and Participant roles managed via Spring Security.
- **Authentication:** JWT token-based login.
- **Caching Layer:** Redis caching for fast analytics retrieval.

- Cloud Deployment: AWS/GCP/Azure hosting with Docker for scalability.

Module 5: Database & Backend Integration

This module integrates the backend APIs and database layer for seamless operation.

- Backend: Spring Boot APIs for survey management and response handling.
- ORM: Hibernate with Spring Data JPA for smooth DB transactions.
- Database: MongoDB to store surveys, responses, and analytics data.
- Scalability: Supports large datasets with cloud and caching infrastructure.

Graphical Representation of Modules

Module	Focus Area
Survey Builder	Survey creation & admin management
Participant Portal	Secure participation & response submission
Result Dashboard	Response aggregation & analytics
Security & Performance	Role-based access & system optimization
Database & Backend	Data storage & system backbone

This modular division ensures clarity in development and role-specific responsibilities. Each module can be developed, tested, and deployed independently while maintaining integration with the overall system. The modular structure also enhances scalability, security, and maintainability, making the project future-ready.
